The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynuclectides, particularly full-length cDNAs of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13632 to AAH19742 represent human cDNA sequences; AAB2246 to AAB95893 represent human amino acid sequences; and AAH13622 to AAH13632 represent coligonuclectides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM7823-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiations. The production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 211 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tang

                                                                                                                                                                                                                                                                                                                                                                      The invention comprises 744 novel mouse DNA sequences (genes). The DNA sequences of the invention are useful for treating cancer, psoriasis, ulcerative colitis, inflammation, ischaemic heart disease, thrombosis, immune disorders, bacterial disorders and viral disorders. The present nucleic acid represents a mouse DNA sequence of the invention. NOTE: The present DNA sequence is not shown in the specification, but has been retrieved from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New mouse nucleic acid molecules and polypeptides, useful for treating cancer, psoriasis, ulcerative colitis, inflammation, ischemic heart disease or thrombosis.

cc reaction (PCR) primers, oligomers, and for chromosome and gene mapping, cand in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cc genes. (I) is useful in gene therapy techniques to restore normal cc useful for generating antibodies against it, detecting or quantitating a cc useful for generating antibodies against it, detecting or quantitating a cc polypeptide in tissue, as molecular weight markers and as a food cc supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders convolving aberrant protein expression or biological activity. The college of the polypucleotide sequences have applications in convolving aberrant protein empping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cc coding sequences of the invention. Note: The sequence data for this cateronic format directly from WIPO at clectronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                       expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased

                     S
                                                                                                                                           The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having conn-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes of the genes is differentially expressed in peripheral blood mononuclear cells (PBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample is a whole blood sample (claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples tislated at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a gene that differentially expressed and detected by the method of the invention. (Note: this sequence is not given as part of the printed specification but was obtained from WIPO in electronic format at

                                                                                                                                                              The invention relates to a novel isolated protein complex comprising a RING-SH 3 polypeptide and a polypeptide selected from a Gag protein, a Gag late domain, PI3K, actin, myosin, Hsp60, Hsp70, Hsp90, STAM1, STAM2A, STAM2B, VHS-UIM, a GTP8se, an E2 enzyme, tsg101, a cullin, RING-SH, and a clathrin. The novel protein complex has virucide activity and can be used to treat disorders as part of a vaccine. The protein complex and composition are useful for detecting cells infected with a virus, for dentifying agents having antiviral activity, and for treating viral disorders caused by retroviruses, rhabdoviruses, or filoviruses. This polymucleotide represents a DNA sequence relating to a protein comprising the RING-SH complex of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated protein complex comprising a RING-SH 3 polypeptide and another polypeptide, useful for detecting cells infected with a virus, and for treating viral disorders caused by retroviruses, rhabdoviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RING-SH 3; Gag protein; Gag late domain; PI3K; actin; myosin; Hsp60; Hsp70; Hsp90; STAM1; STAM2A; STAM2B; VHS-UIM; GTPase; E2 enzyme; tegcullin; RING-SH; clathrin; virucide; vaccine; antiviral; retrovirus;

The polynucleotide of the invention demonstrates antiarteriosclerotic, antipsoriatic and cytostatic activities and may be useful in a composition for detecting the expression of a disease detection and treatment molecule polynucleotide. The molecules of the invention may be utilised to diagnose or treat conditions, diseases or disorders associated with cell signalling, such as arteriosclerosis, psoriasis and cancer. The current sequence is that of a human MDDT cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADL22564 standard; cDNA; 6730

The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIG16176-ABIG30511), expressed DNA sequences (ABIG16176-ABIG30511), expressed DNA sequences (ABIG16176). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format direct from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 3223
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23-MAR-2000; 2000US-0191637P.

The Sp140 polypeptides act as gene transcription regulators. They can be used to develop products for use in the diagnosis and treatment of autoimmune diseases such as primary bilary cirrhosis, rheumatoid arthritis, systemic lupus erythematosus, Sjogren's syndrome, scleroderma and multiple sclerosis, viral diseases including those caused by herpes simplex virus, cytomegalovirus, HIV, hepatitis virus, human T-cell leukaemia, virus-1 (HTMV-1) and adenovirus, and cancers including leukaemias, particularly acute promyelocytic leukaemia, cancers of the breast, ovary, prostate, bone, liver, pancreas or spleen, sarcomas and

                                                                       S
                                                                                                                                                                                    The invention relates to isolated polynucleotide (I) and polypeptide (II) cequences. (I) is useful as hybridisation probes, polymerase chain creation (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cequence. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cities for genetic disorders or other traits to assess biodiversity responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and camino acid sequences. AAS64197-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at the proper cate of the invention willow the printed specification of the sequences.

The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed conditions of (II) are therapy techniques to restore normal constitute of (II) or to treat disease states involving (II). (II) is constituted in tissue, as molecular weight markers and as a food consplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The conjugation of produce other types of data and products dependent on DNA and conditions of conduce other types of data and products dependent on DNA and conditions of the invention. Note: The sequence data for this gatent did not appear in the printed specification, but was obtained in the print of the conditions of the inventions of the conditions of the con

                                                                                                                                                                                                                                                                                                                       reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and and and and and are applied to assess biodiversity and and and and are applied to assess biodiversity and partners are useful for the polynucleotide sequences have application of mutations to responsible for genetic disorders or other traits to assess biodiversity and partners are useful for the polynucleotide sequences have application of mutations are separated to assess biodiversity and partners are useful for the polynucleotide sequences have application of mutations are separated to a page and pa
                                                                                                                                                          and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences (I) is useful as hybridisation probes, polymerase chain

The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with uterine motility such as pregnancy and labour, and menstrual disorders. The polynucleotide sequences of the invention are also useful in gene therapy. AAS28995-AAS29020 represent genomic sequences encoding for novel human uterine motility-association polypeptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of novel human uterine motility-association polypeptides (AAU18094-AAU18152), and cDNA and genomic sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with uterine motility such as pregnancy and labour, and menstrual disorders. The polymucleotide sequences of the invention are also useful in gene therapy. AAS28995-AAS29020 represent genomic sequences encoding for novel human uterine motility-association polypeptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  08-DEC-2000;

The invention relates to isolated nucleic acid molecules and their CC encoded secreted proteins. The nucleic acids and proteins are used to grevent, treat or ameliorate a medical condition in e.g. humans, mice, CC prevent, treat or ameliorate a medical condition in e.g. humans, mice, CC pathological pathological condition or susceptibility to a condition. Antibodies to the proteins can also used in CC pathological condition. Antibodies to the proteins can also be used in CC immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are disgnosed or treated include autoimmune (CC immunoassays c.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, CC nervous system disorders e.g. alzheimer's disease, infections caused by acteria, viruses and fungi and ocular disorders e.g. corneal infection, CC and many other disorders listed in the specification. The polypeptides CC can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before CC responsation, for supporting cell culture of primary tissues, to responsitive or preservative to increase or decrease storage CC capabilities, fat content, lipid, protein, carbohydrate, vitamins, candidative or preservative to increase or decrease storage CC capabilities, fat content, lipid, protein, carbohydrate, vitamins, cc squence is a genomic DNA encoding a partial novel secreted protein of the invention. Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                      밁
                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                          The invention relates to isolated nucleic acid molecules and their CC encoded secreted proteins. The nucleic acids and proteins are used to grevent, treat or ameliorate a medical condition in e.g. humans, mice, crabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to in diagnosing a pathological condition or susceptibility to a condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in claeviating symptoms associated with the disorders and in diagnostic mimunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune cd diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac carrest, cerebrovascular disorders e.g. crecbral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, cand many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, cornearse tsissues and in chemotaxis. The polypeptides can also be used to and in chemotaxis. The polypeptides can also be used cornean, in and in chemotaxis. The polypeptides content, lipid, protein, carbohydrate, tressest to capabilities, fat content, lipid, protein, carbohydrate, The present content, lipid, protein, carbohydrate, by riamins, contents, cornean, contents, and other nutritional components. The present

                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated polypeptide comprising a sequence at least 90% identical to a full length protein sequence selected from 55 compared to the specification such as a sequence of 163, 74 or 140 contained in 49 cDNA clones given in specification, or the encoding sequence contained in 49 cDNA clones given in specification e.g. HCFAT05, HWAAE95 condition in a subject and its encoding nucleic acid are useful for condition in a subject and for preventing, treating or ameliorating a medical condition. The protein is encoding nucleic acid are useful for cantibody that can bind to the protein are useful in treating, preventing, conditions and conditions, inflammatory conditions, graft-versus allergic reactions and conditions, inflammatory conditions, graft-versus fost disease, blood-related disorders, hyperproliferative disorders, candisorders, cardiovascular disorders, respiratory disorders.

CC neurological disorders, endocrine disorders, respiratory disorders. The content of the invention is useful to stimulate neuronal growth and to treat, prevent, and/or diagnose neuronal damage which occurs in certain neuronal disorders or neuro-degenerative conditions, for stimulating characteristics such as body height, weight, hair color, and to increase or decrease storage capabilities, fat content, lipid, protein, components. The nucleic acid of the invention can be used in gene therapy. This polynucleotide sequence represents one of the novel nucleic acids of the invention

Patent No. 6329517

GENERAL INFORMATION:

APPLICANT: Seelig, Hans Peter
APPLICANT: Renz, Manfred

TITLE OF INVENTION: DERNATOMYOSITIS-SPECIFIC AUTO-ANTIGEN
FILE REFERENCE: 8484-0030-999

CURRENT APPLICATION NUMBER: US/08/913,832A

CURRENT FILING DATE: 1998-01-12

PRIOR APPLICATION NUMBER: PCT/DE96/00444

PRIOR FILING DATE: 1996-03-08

NUMBER OF SEQ ID NOS: 2

SOFTWARE: FastSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                               ; IENGTH: 6328
